Investigate a batch renamer

Decide what the tool should do before seeing its output. Then use evidence to identify one issue and design a retest. No coding or installation is needed.

Group _____ Reader _____ Recorder _____ Evidence checker _____ Reporter _____

Task and scope	The button says Rename selected. Give only selected assets exactly one SM_ prefix. Preserve the rest of each name. Already-prefixed names and all unselected assets must stay unchanged.

Selected	Starting name	Expected before reveal	Observed after reveal
Yes	crate_A		
Yes	crate_B		
Yes	SM_crate_C		
No	barrel_D		

1 Problem	Before the reveal: what must stay unchanged, and what evidence would make you trust the result? _____
2 Investigate	After the reveal: With [input], I expected [result], but observed [result]. _____
3 Intervention	What would you change first, and why? Separate the observed behavior from a guessed cause. _____
4 Impact	Retest: starting input + action + exact expected result, including the unselected asset. _____
5 Tradeoff	What remains unknown? Consider a second run, Undo or empty selection. What would testing it cost? _____

Prepare one 20-second finding. Revisit it using the five UI/UX mantras. Keep observation separate from a proposed cause.
