Prepare one peer test

Prepare one bounded task and a starting state. Ask for a result; let the tester choose the steps.

Owner _____ Tool / version _____ Group ____ Letter A / B / C

1 User and goal Who is this for? What do they need to do, and why?

2 Task to read aloud Write one short task. Include the starting input and what must stay unchanged.

3 Success What visible result will you check?

4 Ready to repeat How will you reset? What will you show if the tool cannot run?

Example task: “Try this texture set on the target crate. Leave the protected crate unchanged.”

Ready check: prepared copies • same version • start state ready • reset ready

Choose a mode: hands-on / recording / paper or Figma. A prototype can test understanding; it cannot verify engine behavior.

Test a peer tool

Tester: try the task. Observer: record evidence and help. Owner: watch before coaching.

Round ____ Owner _____ Tester _____ Observer _____

Mode: hands-on / recording / paper or Figma Result: independent / helped / blocked / execution untested

1 Task What result are you trying to reach?

2 Evidence What did you do, expect and observe? Where did you need help?

Use a lens that fits your observation. You do not need to answer every question.

Know the task — Is the goal and scope clear?
Guide the eye — Do grouping, spacing and contrast show what matters?
Make actions clear — Can you tell what to click and what state it is in?
Keep a shared visual language — Do labels, colors and controls mean the same thing?
Test the whole workflow — Can you check the result and recover?

3 Keep and improve One observed strength. One issue or question that matters, and why.

If no issue appeared, say so. Mark what you could not test. Give this sheet to the owner.

7-minute round: task 0:00 • attempt 0:45 • compare evidence 3:45 • finding 5:15 • retest and reset 6:15

Choose one revision

Review your own tool for 4 minutes. Use the final 3 minutes to choose a revision and a retest.

Owner _____ Observed attempts ____ Review mode _____

1 Keep Which strength did a reviewer observe?

2 Prioritize Which issue or uncertainty matters most? Cite a peer's observation and its consequence.

3 Revise What specific change will you make or investigate?

4 Retest State the input, action and expected result. Include what must stay unchanged.

5 Reflect What changed or strengthened your judgment? What is still untested?

One serious failure can matter. Each tool receives one observed attempt with tester and observer perspectives.
